

Compass

A parenting companion for the digital age

Concept brief · working title

The Pitch

"It's an app that teaches parents how to actually use tech to help their kid grow — instead of just handing them a tablet. It learns your family and gives you personalized options... including when to put the screen away."

In One Line

An AI parenting companion that learns your family, turns the chaos of generic advice into concrete steps for YOUR child, and grows with you — teaching you to use technology with intention.

Who It's For

Digital-native millennial and Gen-Z parents — first-time or early — with kids roughly ages 2 to 8. They feel guilty about screen time and default to the tablet to get through the day, but they want better options and don't have time to research them.

Not for: teenagers, non-digital caregivers, or "all parents." Sharp focus on the segment that adopts easily and feels the pain most.

The Problem

1. **Knowledge gap.** Parents want to help their kids but don't know what options technology gives them beyond the tablet. The tools exist; the know-how doesn't — so the screen becomes the default babysitter.
2. **Generic advice.** Parenting advice online is generic and overwhelming. Nothing is tailored to YOUR child or YOUR situation, so parents get buried and never act on it.
3. **No manual.** Nobody teaches you how to parent, and the digital era made it harder. There's no companion that grows with your family and guides you on when tech helps and when it gets in the way.

The Solution

One companion that addresses all three:

- **A coach that learns your family** — It knows your child (age, interests, the context you share) and tells you your options in the moment — not "I don't know what to do besides the tablet," but "for your 4-year-old, try this." Kills the knowledge gap.
- **A translator for generic advice** — Instead of dumping 50 articles, it gives the concrete next step for YOUR situation. Personalization is what turns generic advice into action. Kills generic advice.

- **Grows with you, through memory** — The app accumulates what it learns about your child over time, and the guidance gets sharper every week. The companion that grows with you — not gamified streaks, but deepening understanding. Kills the “no manual” problem.
- **Technology with intention (the soul)** — Every recommendation tells you not just what to do with tech, but when to put it away. This is what sets it apart from everything built to drive more screen time.

Core Features

1. **Conversational Onboarding.** A 5–10 minute guided chat (text or voice) that quickly learns your family — your child’s age, temperament, interests, and what you’re struggling with. It seeds everything else.
2. **Paste & Personalize.** Drop in any parenting content you come across — an article, an Instagram reel, a TikTok, a screenshot — and Compass extracts the real advice, checks it against trusted evidence, and translates it into one concrete next step tailored to your child.
3. **Weekly Drop.** A proactive, personalized feed: each week (or whenever something relevant surfaces) Compass brings you studies, tips, and activities matched to your child right now — so you don’t have to go searching.
4. **“Help Me Now” Voice Coach.** An always-available voice shortcut for the moment of chaos. Hands full and your kid is melting down? Just talk to it. It knows your child, responds instantly, and can act — pulling an activity, setting a timer, or logging the moment.
5. **Planned Activities Calendar.** Plan and schedule activities ahead of time, with reminders so good intentions actually turn into action.
6. **Win Logger + Improvement Loop.** After you try a suggestion, a quick “How did it go?” Compass remembers what worked, sharpens its future advice, and shows you visible progress over time — proof that things are getting better.

Why Now

In 2026, the American Academy of Pediatrics updated its screen-time guidance for the first time in a decade — moving away from rigid time limits toward quality, context, and conversation, and openly acknowledging it can’t be prescriptive because every family is different. That shift demands exactly what this app provides: personalized, context-aware guidance for your specific child.

At the same time, nearly half of parents report using screens to manage difficult behavior, and official guidelines often go unused because parents don’t know about them or how to apply them. The need is real, documented, and currently unmet.
